1 Introduction and scope

This report describes the calculation procedure and data considered in order to design the foundation of a new apartment building in Eau Claire, Wisconsin.

The construction consists in a three-story apartment building with a first-floor footprint of about 19,500 square feet, a below-grade parking garage with a footprint of about 27,200 square feet, perimeter retaining walls, a slab-on-grade, and a conventional foundation system.

The first floor system is precast hollow core concrete plank on precast beams and columns. For the upper floors and roof, the system is wood-framed. Retaining walls and slab on grade are comprised of cast in place concrete, except for three reinforced CMU walls next to the garage aisles, that will be demolished during the second phase of construction.

The foundation uses conventional cast in place concrete footings to transfer axial compression and lateral loads to the ground.

2 Building codes

The following building and material codes were used for the design:

- Building code
  - International Building Code, 2018 Edition (IBC 2018) with reference to Minimum Design Loads for Buildings and Other Structures by the American Society of Civil Engineers, 2016 Edition (ASCE 7).
- Material codes

– Reinforced Concrete: Building Code Requirements for Structural Concrete and Commentary by the American Concrete Institute, 2019 Edition (ACI 318).
– Masonry: Building Code Requirements and Specification for Masonry Structures and Companion Commentaries, 2013 Edition (ACI 530/530).

3 Loading criteria

A summary of the project-specific loading criteria follows (see appendix A for a detailed list of load values).

3.1 Gravity loading

The gravity loads listed in Table 1 are in addition to the self weight of the structure. The minimum loading requirements were taken from ASCE 7 as well as the loading criteria supplied by the engineer of record. Loads are given in pounds per square foot (psf).

Table 1: **Gravity Loads**

Use	**Live Loading**	**Superimposed Dead Loading**
Parking Garage	40	3
Storage/HVAC	125	28
Stairways, exits	100	28
Level 1 residential	40	28
Level 1 corridors	100	28
Level 1 office, recreational	100	28
Level 1 courtyard (footprint)	150	150
Elevated levels residential	40	28
Elevated levels corridors	40	28
Cornices	60	-
Balconies	40	28
Roof	20	28

In addition to these uniform slab loads, a perimeter dead load of 12 psf was applied to the structure to account for the weight of the cladding system.

3.2 Wind design criteria

Wind loading is in accordance with the IBC and ASCE 7 requirements as shown in Table 2.

3.3 Snow loading

Wind loading is in accordance with the ASCE 7 requirements as shown in Table 3.

Table 2: **Wind Design Criteria**

Parameter	Value
Basic Wind Speed, 3-second gust (ultimate)	115 mph
Basic Wind Speed, 3-second gust (nominal)	90 mph
Exposure	B

Snow load flat roof	42 psf

4 Seismic design criteria

Seismic loads are in accordance with the IBC requirements as shown in Table 4.

Table 4: **Seismic Design Criteria**

Parameter	Value
Building Latitude/Longitude	44^o49'01.8"N 91^o30'34.8"W

8 Structural model

A three-dimensional elastic computer model of the substructure is analyzed using XC. The model includes first floor frame and columns (see figure 1). The hollow core planks ar modelled using shell elements, while beams and columns are modelled using frame elements. Loads transmited by 2^{nd}, 3^{rd} floors and roof are applied to the 1^{st} for each load case as shown in figures 2 to 9.

Linear loads are expressed in kN/m and surface loads in kN/m^2, where:

$$
\begin{aligned}
1\ \text{kN/m} &= 68.52178\ \text{lb/ft} \\
1\ \text{kN/m}^2 &= 20.885434\ \text{psf}
\end{aligned}
$$

9 Basement walls

9.1 Introduction

The design is bassed in the following assumptions:

- Design wall with pinned base and pinned top.
- Neglect corner regions (wall spans one-way only).
- Top slab is in place and has achieved full strength prior to backfilling.
- Vehicular traffic around the building is represented by a uniform load of 250 psf (11.97 kN/m^2).
- The vertical response of the soil calculated using a Winkler model with a subgrade reaction module of set of 200 pounds per cubic inch (54.29×10^6 N/m^3).
- Water table deep below structure.

9.2 Load determination

9.2.1 Self weight

The self weight of the reinforced concrete is calculated from its density: 2500 kg/m^3.

9.2.2 Axial loads from building

The loads transferred by the top slab to the wall are as follows:

Building side	**Load**	**Phase 1** (kN/m)	**Phase 2** (kN/m)
North	SnowL	10.06	10.06
North	LiveL	21.67	21.67

West	Wind_WE	-13.20	-13.20
West	DeadL	29.81	29.81

9.2.3 Earth pressure

The soil pressure over the wall has been calculated using the lateral pressure at rest with a coefficient $K_0 = 0.5$.
