## List of Figures

## 1 Building codes

The following building and material codes were used for the design:

 $\bullet\,$  Building code

 International Building Code, 2018 Edition (IBC 2018) with reference to Minimum Design Loads for Buildings and Other Structures by the American Society of Civil Engineers, 2016 Edition (ASCE 7).

#### • Material codes

- Reinforced Concrete: Building Code Requirements for Structural Concrete and Commentary by the American Concrete Institute, 2019 Edition (ACI 318).
- Masonry: Building Code Requirements and Specification for Masonry Structures and Companion Commentaries, 2013 Edition (ACI 530/530).

## 2 Loading criteria

A summary of the project-specific loading criteria follows (see appendix A for a detailed list of load values).

#### 2.1 Gravity loading

The gravity loads listed in Table 1 are in addition to the self weight of the structure. The minimum loading requirements were taken from ASCE 7 as well as the loading criteria supplied by the engineer of record. Loads are given in pounds per square foot (psf).

UseSuperimposed Live Loading Dead Loading Parking Garage 40 3 125 28 Storage/HVAC Stairways, exits 100 28 Level 1 residential 40 28 Level 1 corridors 100 28 Level 1 office, recreational 100 28 Level 1 courtyard (footprint) 150 150 Elevated levels residential 40 28 Elevated levels corridors 40 28 Cornices 60 28 Balconies 40 Roof 20 28

Table 1: Gravity Loads

In addition to these uniform slab loads, a perimeter dead load of 12 psf was applied to the structure to account for the weight of the cladding system.

#### 2.2 Wind design criteria

Wind loading is in accordance with the IBC and ASCE 7 requirements as shown in Table 2.

#### 2.3 Snow loading

Wind loading is in accordance with the ASCE 7 requirements as shown in Table 3.
